Barley, oat and rye varieties currently grown in North Dakota are described in the following tables. Successful production of these crops depends on numerous factors, including selecting the right variety for a particular area. Characteristics to evaluate in selecting a variety are yield potential in your area, test weight, straw strength, plant height, reaction to problematic diseases and maturity. Selecting varieties with good quality also is important to maintain market recognition. Because malting barley is purchased on an identity-preserved basis, producers are encouraged to determine which barley varieties are being purchased by potential barley buyers before selecting a variety. When selecting a high-yielding and good-quality variety, use data that summarizes several years and locations. Additional data from county sites are available at [www.ag.ndsu.edu/varietytrials/](http://www.ag.ndsu.edu/varietytrials/) and from each Research Extension Center.

The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. The LSD (Least Significant Difference) numbers beneath the columns in tables are derived from these statistical analyses and apply only to the numbers in the column in which they appear. Differences between two varieties exceeding the LSD value mean that, with 95 percent confidence (LSD probability 0.05), the higher-yielding variety has a significant yield advantage. When no statistical difference occurs among any of the varieties at the 95 percent level of probability, NS is used. The CV is a measure of variability in the trial. The CV stands for coefficient of variation and is expressed as a percentage. Large CVs mean a large amount of variation could not be attributed to differences in the varieties.

### List of Tables

- Table 1. 2010 North Dakota barley variety descriptions.
- Table 2. Yield and test weight of barley varieties at three locations in eastern North Dakota, 2008-2010.
- Table 3. Plump and protein of barley varieties at three locations in eastern North Dakota, 2010.
- Table 4. Yield and test weight of barley varieties at three locations in western North Dakota, 2008-2010.
- Table 5. Plump and protein of barley varieties at three locations in western North Dakota, 2010.
- Table 6. 2010 North Dakota oat variety descriptions.
- Table 7. Yield and test weight of oat varieties at two locations in eastern North Dakota, 2008-2010.
- Table 8. Yield and test weight of oat varieties at three locations in western North Dakota, 2008-2010.
- Table 9. 2010 North Dakota winter rye variety descriptions.
- Table 10. Yield and test weight of winter rye varieties at two locations in North Dakota, 2010.

<sup>1</sup> M = malting; MT = Being tested in plant scale tests for malting and brewing quality; F = feed; SP = special uses (hulless).

<sup>2</sup> BARI = Busch Agricultural Resources Inc.; Can = Canada; MN = University of Minnesota; MT = Montana State University; ND = North Dakota State University.

<sup>3</sup> R = rough; S = smooth; H = hulless.

<sup>4</sup> S = short; L = long.

<sup>5</sup> R = resistant; MR = moderately resistant; MS = moderately susceptible; S = susceptible; NA = not available.

<sup>6</sup> Moderately resistant to Fusarium head blight.

<sup>7</sup> Lower DON accumulations than other varieties tested.

<sup>8</sup> Recommended as a malting barley in western U.S.

Presentation of data for the entries tested does not imply approval or endorsement by the authors or agencies conducting the test. North Dakota State University approves the reproduction of any table in this publication only if no portion is deleted, if appropriate footnotes are given and if the order of the data is not rearranged.
