

North Dakota Durum Wheat

Variety Trial Results for 2008 and Selection Guide

Compiled by:

Joel K. Ransom, Extension Agronomist

Frank Manthey, Cereal Scientist

Elias Elias, Durum Breeder

Durum was planted on 1.7 million acres in North Dakota in 2008, up from the previous year but down from historic highs. Most durum is grown in northwestern North Dakota. Conditions in that region in 2008 were generally dry, so yields were lower than the long-term average. The most commonly grown varieties in 2008 were Lebsock, Mountrail and Ben, occupying 26.7 percent, 21.0 percent and 10.3 percent of the acreage planted, respectively. Divide and Pierce were the next most important varieties, with each being planted on about 8 percent of the area.

Durum varieties are tested each year at multiple sites throughout North Dakota. The relative performance of these varieties is presented in table form. Variety performance data are used to provide variety recommendations to producers. Some varieties may not be included in the tables due to insufficient testing or lack of seed availability, or they offer no yield or disease advantage over similar varieties. Additional data from county sites are available in "Crop Production Guide 2009" (No. 19) and from each Research Extension Center at www.ag.ndsu.edu/variety/durum.html. Descriptions of the most commonly grown varieties in the region are included for informational purposes. Use data from multiple locations and years when selecting a variety.

Information contained in this publication is based on research conducted by the following North Dakota Agricultural Experiment Station scientists, plant breeders, cereal chemists and plant pathologists:

Blaine Schatz – Carrington
Steve Zwinger – Carrington
Glenn Martin – Dickinson
Eric Eriksmoen – Hettinger
Bryan Hanson – Langdon
Mark Halvorson – Minot
Neil Riveland – Williston

Brian Sorenson – Northern Crops Institute
Timothy Friesen – USDA Plant Pathologist
Jack Rasmussen – Plant Pathology
Tika Adhikari – Plant Pathology
Shaukat Ali – Plant Pathology
Marcia McMullen – Extension Plant Pathology

NOVEMBER 2008

Successful durum production depends on numerous factors, including selecting the right variety for a particular area. The information included in this publication is meant to aid in selecting that variety or group of varieties. Characteristics to consider in selecting a variety are yield potential in your area, test weight, straw strength and plant height, reaction to important diseases and maturity. Selecting varieties with good milling and pasta quality also is important to maintain market recognition.

Every growing season differs; therefore, when selecting a top-yielding variety, use data that summarize several years and locations. Choose the variety that, on average, performs the best at multiple locations near you, and if data are available, for several years.

Durum wheat varieties currently grown in North Dakota are described in the following tables. Presentation of data for the entries tested does not imply approval or endorsement by the authors or agencies conducting the test. North Dakota State University approves the reproduction of any table in the publication only if no portion is deleted, appropriate footnotes are given and the order of the data is not rearranged.

The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. These analyses enable the reader to determine, at a predetermined level of confidence, if the differences observed among varieties are reliable or if they might be due to error inherent in the experimental process. The LSD (Least Significant Difference) numbers beneath the columns in tables are derived from these statistical analyses and only apply to the numbers in the column in which they appear. If the difference between two varieties exceeds the LSD value, it means that with 95 percent confidence (LSD probability 0.05) that the higher-yielding variety has a significant yield advantage. If the difference is less than the LSD value, the variety difference is probably due to environmental factors (for example, one plot may have been in an area of the experiment with better soil than the other). NS is used to indicate no significant difference for that trait among any of the varieties at the 95 percent level of probability. The CV is a measure of variability in the trial. The CV stands for coefficient of variation and is expressed as a percentage. Large CVs mean a large amount of variation that could not be attributed to differences in the varieties.

List of Tables

- Table 1. North Dakota durum wheat variety description, agronomic traits, 2008.
- Table 2. North Dakota durum wheat variety quality descriptions, milling and processing data averaged for five years (2003-2007) from advanced yield trials.
- Table 3. North Dakota durum wheat variety quality descriptions, milling and processing data for 2007 at all locations in the advanced yield trials.
- Table 4. Yield of durum varieties at two locations in eastern North Dakota, 2006-2008.
- Table 5. Yield of durum varieties at four locations in western North Dakota, 2006-2008.
- Table 6. Protein at 12 percent moisture of durum varieties at five locations in North Dakota, 2008.

1 Refers to agent or developer: Can = Agriculture Canada, WB = Westbred, ND = North Dakota State University, DGP = Dakota Growers Pasta.

2 R = resistant; MR = moderately resistant (slow rusters); M = intermediate; MS = moderately susceptible; S = susceptible; VS = very susceptible; Foliar Disease = reaction to tan spot and septoria leaf spot complex. Letter ratings for head blight (scab) based on visual head symptoms. * Indicates yields and/or quality often have been higher than would be expected based on visual symptoms. NA = Not adequately tested.

¹ Wheat protein is reported on a 12% moisture basis

² Mixograph: 1 = very weak and 8 = very strong dough-mixing properties indicating strong gluten proteins

³ Spaghetti Color Score: Higher number indicates better color, with 8.5+ typically considered good

⁴ Overall Quality is determined based on agronomic, milling and spaghetti processing performance

⁵ Rugby has weak gluten, but is desired for certain pastas, such as bow-ties, but not for spaghetti

⁶ Alzada has a disease-resistance package that is best suited for western North Dakota (drier growing conditions)
