This brewery looks to be a model for new manufacturing facilities. Each of the brewing spaces has abundant natural light while keeping direct sunlight at bay. The spaces are designed to reduce water usage as well as wasted energy. The spaces feature open-plan systems, allowing all client flows in which each part of the brewing process happens.

The employees are given a space for brewing while still being able to view and learn from the process. Below this space is the separate mechanical system which is vented to maintain an indoor air quality.

The office uses an open-plan space with three zones. There’s an open area with tables and computers for the majority of the daily work. One zone of the office also is a highly social area and a quiet one with individual desks for private or more focused working.

The office space also has abundant light as well as operable windows to allow for natural ventilation. To help maintain a high level of employee morale one of the prime features of the building was dedicated to the employee break space which was plenty of seating, a full kitchen, and a large rooftop deck.
