

North Dakota

Barley, Oat, Rye and Flax

Variety Trial Results for 2008 and Selection Guide

Compiled by:

Joel K. Ransom and Hans Kandel

Extension Agronomists

Barley, oat, rye and flax varieties are tested each year at multiple sites throughout North Dakota. The relative performance of these varieties is shown in table form. Variety performance data are used to provide variety recommendations to producers.

Some varieties may not be included in the tables because of insufficient testing or lack of seed availability, or they offer no yield or disease advantage over similar varieties. Additional data from county sites are available at www.ag.ndsu.edu/variety/index.htm and from each Research Extension Center. Descriptions of the most commonly grown varieties in the region are included for informational purposes.

Information contained in this publication is based on research conducted by the following North Dakota Agricultural Experiment Station scientists, plant breeders, cereal scientists and plant pathologists:

Blaine Schatz - Carrington

Steve Zwinger - Carrington

Glenn Martin - Dickinson

Eric Eriksmoen - Hettinger

Bryan Hanson - Langdon

Mark Halvorson - Minot

Neil Riveland - Williston

Tim Friesen - USDA Plant Pathologist

Jim Hammond - Flax Breeder

Rich Horsley - Barley Breeder

Mike McMullen - Oat Breeder

Stephen Neate - Plant Pathology

Paul Schwarz - Cereal Scientist

Barley, oat, rye and flax varieties currently grown in North Dakota are described in the following tables. Successful production of these crops depends on numerous factors, including selecting the right variety for a particular area. The information included in this publication is meant to aid in selecting that variety or group of varieties. Characteristics to evaluate in selecting a variety are yield potential in your area, test weight, straw strength, plant height, reaction to important diseases and maturity. Selecting varieties with good quality also is important to maintain market recognition. Because malting barley is purchased on an identity-preserved basis, producers are encouraged to determine which barley varieties are being purchased by potential barley buyers before selecting a variety.

When selecting a high-yielding and good-quality variety, use data that summarizes several years and locations. Choose the variety that, on average, performs the best at multiple locations near you during several years.

Presentation of data for the entries tested does not imply approval or endorsement by the authors or agencies conducting the test. North Dakota State University approves the reproduction of any table in the publication only if no portion is deleted, if appropriate footnotes are given and if the order of the data is not rearranged.

The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. These analyses enable the reader to determine, at a predetermined level of confidence, if the differences observed among varieties are reliable or if they might be due to error inherent in the experimental process. The LSD (Least Significant Difference) numbers beneath the columns in tables are derived from these statistical analyses and apply only to the numbers in the column in which they appear. Differences between two varieties exceeding the LSD value mean that with 95 percent confidence (LSD probability 0.05), the higher-yielding variety has a significant yield advantage. If the difference is less than the LSD value, the variety difference probably is due to environmental factors (for example, one plot may have been in an area of the experiment with better soil than the other). When no statistical difference occurs among any of the varieties at the 95 percent level of probability, NS is used. The CV is a measure of variability in the trial. The CV stands for coefficient of variation and is expressed as a percentage. Large CVs mean a large amount of variation could not be attributed to differences in the varieties.

¹ M = malting; MT = Being tested in plant scale tests for malting and brewing quality; F = feed; SP = special uses (hulless)

² BARI = Busch Agricultural Resources Inc.; MN = University of Minnesota; MT = Montana State University; ND = North Dakota State University.

³ R = rough; S = smooth.

⁴ S = short; L = long.

⁵ R = resistant; MR = moderately resistant; MS = moderately susceptible; S = susceptible; NA = not available.

⁶ Moderately resistant to Fusarium head blight.

⁷ Lower DON accumulations than other varieties tested.

⁸ Recommended as a malting barley in western U.S.
